More Practice with Linked Lists

```
public class SLList {
1
2
        private class IntNode {
3
             public int item;
            public IntNode next;
4
            public IntNode(int item, IntNode next) {
5
                 this.item = item;
6
                 this.next = next;
7
             }
8
        }
9
10
        private IntNode first;
11
12
        public void addFirst(int x) {
13
             first = new IntNode(x, first);
14
        }
15
    }
16
```

1.1 Implement SLList.insert which takes in an integer x and an integer position. It inserts x at the given position. If position is after the end of the list, insert the new node at the end.

For example, if the SLList is $5 \rightarrow 6 \rightarrow 2$, insert(10, 1) results in $5 \rightarrow 10 \rightarrow 6 \rightarrow 2$ and if the SLList is $5 \rightarrow 6 \rightarrow 2$, insert(10, 7) results in $5 \rightarrow 6 \rightarrow 2 \rightarrow 10$. Additionally, for this problem assume that position is a non-negative integer.

```
public void insert(int item, int position) {
```

$\mathbf{2}$ Linked Lists & Arrays

Add another method to the SLList class that reverses the elements. Do this using the existing IntNode objects (you should not use **new**).

```
public void reverse() {
1
```

Extra: If you wrote reverse iteratively, write a second version that uses recursion 1.3 (you may need a helper method). If you wrote it recursively, write it iteratively.

Arrays

2.1 Consider a method that inserts an int item into an int[] arr at the given position. The method should return the resulting array. For example, if x = [5, 9, 14, 15], item = 6, and position = 2, then the method should return [5, 9, 6, 14, 15]. If position is past the end of the array, insert item at the end of the array.

Is it possible to write a version of this method that returns void and changes arr in place (i.e., destructively)? *Hint:* These arrays are filled meaning an array containing n elements will have length n.

Extra: Fill in the below according to the method signature:

public static int[] insert(int[] arr, int item, int position) {

2.2 Consider a method that destructively reverses the items in arr. For example calling reverse on an array [1, 2, 3] should change the array to be [3, 2, 1]. Write the reverse method:

public static void reverse(int[] arr) {

4 Linked Lists & Arrays

- 2.3 Extra: Write a non-destructive method replicate(int[] arr) that replaces the number at index i with arr[i] copies of itself. For example, replicate([3, 2, 1]) would return [3, 3, 3, 2, 2, 1]. For this question assume that all elements of the array are positive.
 - public static int[] replicate(int[] arr) {
