

## 1 Flatten

Write a method `flatten` that takes in a 2-D array `x` and returns a 1-D array that contains all of the arrays in `x` concatenated together.

For example, `flatten({{1, 2, 3}, {}, {7, 8}})` should return `{1, 2, 3, 7, 8}`.  
(Summer 2016 MT1)

```
1 public static int[] flatten(int[][] x) {
2     int totalLength = 0;
3     for (int i = 0; i < x.length; i++) {
4         totalLength += x[i].length;
5     }
6     int[] a = new int[totalLength];
7     int aIndex = 0;
8     for (int i = 0; i < x.length; i++) {
9         for (int j = 0; j < x[i].length; j++) {
10            a[aIndex] = x[i][j];
11            aIndex++;
12        }
13    }
14    return a;
15 }
```

## 2 Skippify

Suppose we have the following `IntList` class, as defined in lecture and lab, with an added `skippify` function.

Suppose that we define two `IntLists` as follows.

```
1 IntList A = IntList.list(1, 2, 3, 4, 5, 6, 7, 8, 9, 10);
2 IntList B = IntList.list(9, 8, 7, 6, 5, 4, 3, 2, 1);
```

Fill in the method `skippify` such that the result of calling `skippify` on A and B are as below:

- After calling `A.skippify()`, A: (1, 3, 6, 10)

- After calling `B.skippify()`, B: (9, 7, 4)

(Spring '17, MT1)

```
1 public class IntList {
2     public int first;
3     public IntList rest;
4
5     @Override
6     public boolean equals(Object o) { ... }
7     public static IntList list(int... args) { ... }
8
9     public void skippify() {
10         IntList p = this;
11         int n = 1;
12         while (p != null) {
13             IntList next = p.rest;
14             for (int i = 0; i < n; i += 1) {
15                 if (next == null) {
16                     break;
17                 }
18                 next = next.rest;
19             }
20             p.rest = next;
21             p = p.rest;
22             n++;
23         }
24     }
25     ...
26 }
```

### 3 Sans

Fill in the blanks below to correctly implement `ilsans` and `dilsans`.  
 (Spring '18, MT1)

```

1  public class IntList {
2      public int first;
3      public IntList rest;
4      public IntList (int f, IntList r) {
5          this.first = f;
6          this.rest = r;
7      }
8
9      /** Non-destructively creates a copy of x that contains no y. */
10     public static IntList ilsans(IntList x, int y) {
11         if (x == null) {
12             return null;
13         }
14         if (x.first == y) {
15             return ilsans(x.rest, y);
16         }
17         return new IntList(x.first, ilsans(x.rest, y));
18     }
19
20     /** Destructively creates a copy of x that contains no y,
21     without using the keyword "new". */
22     public static IntList dilsans(IntList x, int y) {
23         if (x == null) {
24             return null;
25         }
26         x.rest = dilsans(x.rest, y);
27         if (x.first == y) {
28             return x.rest;
29         }
30         return x;
31     }
32 }
```
